1/1 answered

Q1 Customer Registration Data Analyzer

20 marks

An online shopping portal stores customer details in the following format:

Name|Email|City|Product

Example:

Rahul Sharma|rahul123@gmail.com|Chennai|Laptop

Read the customer record and perform the following operations.

Remove leading and trailing spaces from the input.

Split the input using the delimiter |.

Extract and store:

Customer Name

Email

City

Product

Print the length of the customer's name.

Print the first character of the customer's name.

Print the first name only.

Check whether the email contains '@' and ends with .com.

Check whether the city starts with the letter 'C' (case insensitive).

Replace every space in the customer name with an underscore (_).

Print the product name in uppercase.

Replace every space in the customer name with an underscore (_).

Print the product name in uppercase.

Print the city name in lowercase.

Print the position of '@' in the email.

Print the last occurrence of the letter 'a' in the customer name.

If the city is "Chennai" (ignoring case), print Local Customer; otherwise print Outside Customer.

Input Format

A single string in the format

Name|Email|City|Product

Output Format

Print the following:

Name Length : <length>

First Character : <character>

First Name : <firstname>

Email : Valid/Invalid

City Starts With C : Yes/No

Modified Name : <name_with_underscores>

Product : <UPPERCASE>

City : <lowercase>

@ Position : <index>

Last Index of a : <index>

Customer Type : Local Customer / Outside Customer
